

WHAT IS AURUM?

A professional marketplace for buying & selling debt portfolios.

Aurum is a **secure, invite-only online platform** where banks and financial institutions can list loan portfolios they want to sell, and where qualified investors can browse listings, review sensitive documents, and place bids — all within a structured, legally protected process.

Think of it like a **private real estate listing site**, but for financial assets — with strict access controls, signed agreements before anyone sees confidential data, and a full audit trail of every action. The platform is **fully built, deployed, and live** as of May 2026 — and has been further elevated with a professional animation layer, personalization system, and polished interaction design.

THE JOURNEY

Five phases. All complete.

PHASE 1 · COMPLETE

Core Platform

Login, listings, dashboard, and basic deal flow assembled from scratch.

PHASE 2 · COMPLETE

Institutional Workflows

NDA signing, admin approval, bidding, pipeline, and messaging all wired up.

PHASE 3 · COMPLETE

Security & Hardening

Every known security gap closed. Error monitoring, rate limiting, and audit trails live.

PHASE 4 · COMPLETE

Production Ready

Automated quality gates, performance budgets, and live infrastructure all active.

PHASE 5 · COMPLETE

UX Excellence

iOS-grade animations, personalization system, and listing page overhaul delivered.

PLATFORM HEALTH

Overall Score: Start vs. Now

AT THE START

B-

DELIVERED

A

The platform launched with a solid foundation but had gaps that would have made it unsafe for real financial transactions. After five focused phases — security hardening, production infrastructure, and now a full UX elevation — **the platform operates at the standard of an institutional financial product**, with the interaction quality and personalization depth of a best-in-class SaaS application.

Everything That's Live on the Platform

Secure Login & Account System

Users register, get reviewed by an admin, and only gain access once approved. Passwords are encrypted and protected.

Listing Browser

Sellers post loan portfolios with full details. Investors browse with advanced filters, saved searches, and grid or list view.

NDA & Document Gate

Sensitive files locked behind a digital NDA with a guided 3-step signing flow. Investors sign first, then get access — logged precisely.

Bidding System

Investors place bids, sellers review and respond. The full offer history is tracked with color-coded status badges throughout.

Deal Pipeline

A visual tracker showing where every deal stands — from initial bid to due diligence to closed.

Messaging System

Buyers and sellers can communicate directly within the platform — fully logged and secure, with a 1,000-character message composer.

Admin Control Panel

Administrators approve users, manage listings, and oversee all activity from a dedicated dashboard.

Mobile Responsive

The platform works on phones, tablets, and desktops — no separate app required.

Spring Animation Layer NEW

Every modal, notification, button press, and page transition now uses iOS-grade spring physics — the feel of a premium native application.

Personalization System NEW

Users choose their accent color, navigation style, layout density, and number format. Preferences are saved and applied instantly across the entire platform.

Top-Bar Navigation NEW

An optional horizontal navigation bar with animated dropdown menus per section — an alternative to the default sidebar, built for power users who want more screen space.

BY THE NUMBERS

What Five Phases Delivered

6

Security vulnerabilities identified and closed before launch

41

Automated checks that run every time a code update is made

15+

Individual spring animations across all key interactions

4

Accent themes users can choose from — Gold, Sapphire, Obsidian, Emerald

A

Final overall platform grade, up from B- at the start

SINCE PUBLICATION

Continued Refinements — May 9 to May 25

Phase 5 was complete on May 9. The two weeks since have been spent on **reliability tuning and marketing-surface polish** — the kind of maintenance work that compounds over the life of a platform, not headline features.

RELIABILITY & SECURITY

- ✓ **High-severity dependency patched** — a publicly-disclosed vulnerability in our web framework was closed within hours of disclosure.
- ✓ **Date handling hardened across all data routes** — every save path now defensively converts incoming date values, eliminating an entire class of edge-case errors.
- ✓ **Auto-calculated delinquency** — listings now derive average days delinquent automatically from the loan's next-due date when a seller doesn't provide it manually.

LISTING & LANDING POLISH

- ✦ **First Mortgage tile redesigned** — replaced cluttered metrics with a single high-signal "Time in Default" indicator on the listing detail page.

- ✦ **Unpaid Balance display synced** with the underlying First Mortgage current balance — investors now see consistent UPB numbers across every view.
- ✦ **Public landing page rewired** — the marketplace preview grid now pulls the three newest active listings live from the database rather than rendering placeholder content.

PHASE 5 — INTERACTION DESIGN

The Feel of a Native iOS Application

The platform previously looked institutional but felt static — every modal snapped open and closed abruptly, buttons had no press feedback, and page navigation felt like reloading a webpage.

That's now been replaced with a **full spring animation layer** — the same physics-based motion system used by Apple's iOS and premium SaaS products like Linear and Vercel. Every interaction now has a beginning, middle, and end.

SUBMIT BID / LOI

Spring modal entrance

The bid form scales up from 94% and rises 20px into position. The backdrop blurs and fades in behind it. Closing reverses both in 140ms — no hard cuts.

EMPTY BID AMOUNT

Shake on error

Submitting without an amount shakes the input field left-right four times — the same feedback used by iOS for a wrong passcode. Clear, immediate, hard to miss.

SUCCESSFUL BID

Staggered reveal

The green confirmation card springs into view, then the checkmark icon pops in a fraction of a second later, and the amount text slides in behind it. Three beats, one satisfying moment.

SAVE A LISTING

Bookmark bounce

The bookmark icon bounces to 145% of its size and springs back on save — a tactile confirmation that the action registered. Fills with gold on save, empties on remove.

NOTIFICATION APPEARS

Slide-in, slide-out

Toasts spring in from the bottom-right with a subtle scale effect. When dismissed — manually or automatically — they slide out to the right and the stack closes the gap smoothly.

NAVIGATE TO A NEW PAGE

Spring page transition

Page content fades and rises 8px into position on every route change. The exit is a quick 100ms fade. The result is a sense of forward motion through the application.

The Platform Adapts to Each User

WHAT USERS CAN CUSTOMIZE

- ✦ **Navigation layout** — choose between the classic left sidebar or a horizontal top bar with dropdown menus per section
- ✦ **Accent color theme** — Gold (default), Sapphire blue, Obsidian silver, or Emerald green, cascading through the entire interface
- ✦ **Layout density** — Compact for data-heavy professionals, Standard for everyday use, Spacious for a more open reading experience
- ✦ **Listings view** — toggle between a card grid and a data-dense list view directly from the filter bar
- ✦ **Number format** — abbreviated (\$1.2M) or full (\$1,200,000), depending on how precisely you need to work

HOW IT WORKS

- ✓ **Instant preview** — every change applies to the live interface the moment you tap it, with no save button and no page reload
- ✓ **Persistent across sessions** — preferences are saved to the browser and restored automatically on the next visit
- ✓ **Spring-animated drawer** — the preferences panel slides in from the right using the same physics-based spring system as the rest of the interface
- ✓ **Zero performance cost** — color and density changes are applied via a single CSS attribute on the page root; no components re-render
- ✓ **One-tap reset** — a "Reset to defaults" button at the bottom of the preferences panel returns everything to the original state

THE FOUR ACCENT THEMES

Gold

The default. Warm, prestigious, and institutional — the look of a private banking desk.

Sapphire

Institutional blue — the palette of Bloomberg, JPMorgan, and traditional finance tools.

Obsidian

Pure monochrome silver. Ultra-minimal — for users who want the data to do all the talking.

Emerald

Growth and returns. For investors focused on yield — the color of good news on a screen.

PHASE 5 — LISTING DETAIL

Every Listing Page Now Tells the Full Story Immediately

BEFORE

- ✗ Key financial figures (UPB, loan count, asking price) buried below the fold in a card section
- ✗ Bid history badges were plain translucent grey regardless of bid status
- ✗ NDA sign flow: a checkbox and a button — no indication of what came next
- ✗ Saving a listing gave no feedback — no confirmation it actually worked
- ✗ Modals opened and closed instantly — no transition, no sense of depth

AFTER

- ✓ A metrics strip directly below the title shows UPB, asking price, loan count, and lien position at a glance
- ✓ Bid status badges are color-coded — gold for pending, green for accepted, red for declined, orange for countered
- ✓ NDA flow now has a 3-step indicator (Review → Acknowledge → Access) so users always know where they stand
- ✓ Saving a listing triggers an animated bookmark bounce and a confirmation toast that slides in and out
- ✓ Every modal springs in with physics and exits with a soft pull-back — the same on desktop and mobile

SECURITY

How the Platform Protects Everyone on It

BUILT-IN PROTECTIONS ✓

- ✓ **Encrypted passwords** — stored in a format that can't be read, even if stolen

- ✓ **Admin approval before access** — no one gets in without manual review
- ✓ **Browser-level security headers** — stops common web attack vectors before they load
- ✓ **Automatic session checks** — if a user is suspended, they're locked out immediately
- ✓ **Input validation on every form** — malformed or malicious data is rejected at the front door

GAPS WE CLOSED ✓

- ✓ **Approval codes are now encrypted** — previously stored in a readable format; now fully protected
- ✓ **Admin emails are now tamper-proof** — hackers could no longer inject fake content into system emails
- ✓ **Traffic controls stay active even under stress** — login gates remain locked even if part of the system goes down
- ✓ **Replaced a flawed third-party tool** — swapped out a software library with a known public security flaw
- ✓ **Every update is auto-scanned** — security checks run automatically on each code change before it goes live

BEHIND THE SCENES

What's Protecting the Platform 24/7

ERROR & PERFORMANCE MONITORING

- ✓ **Real-time error alarm system** — the moment something breaks in production, we're notified automatically with full details
- ✓ **Bug replay tool** — if a user hits an error, we can replay exactly what they experienced to reproduce and fix it
- ✓ **Automated speed tests** — every code update is tested for page load performance before it goes live

AUTOMATED QUALITY GATES

- ✓ **Code quality checks** — every update is automatically reviewed for errors and inconsistencies before merging
- ✓ **41 automated tests** — a suite of checks that verify core platform logic runs correctly after every change
- ✓ **Security dependency scan** — every update is checked against a database of known software vulnerabilities
- ✓ **Traffic rate limiting** — prevents any single user or bot from overloading the platform with requests

The Forward Roadmap

NEXT

Two-Factor Login (2FA)

Adding a second layer of login security — a one-time code sent to your phone — for users who require it or where compliance demands it.

NEXT

Staggered List Animations

Listing cards and dashboard rows animate in one at a time when a page loads — reinforcing the feeling that data is arriving live, not statically rendered.

3–6 MONTHS

Personal Data Encryption

Encrypting sensitive user details directly in the database — an upgrade that satisfies stricter institutional and regulatory compliance requirements.

3–6 MONTHS

High-Volume Database Scaling

Preparing the database layer to handle significantly higher transaction volume as the platform grows and onboards institutional participants.
